

SLM Deployments

On-prem, air-gapped, VPC, edge.

We take a model from feasibility — or build one from scratch — and ship it to your infrastructure. You own the weights, the serving stack, and the data. We handle the quantization, the inference server selection, the observability, and the rollback path.

ALL CAPABILITIES

The whole vertical slice, not a fragment.

Where it runs

Wherever your security team is comfortable.

- On-prem bare metal (H100, A100, MI300, custom silicon)
- Air-gapped networks with no outbound traffic
- Your existing VPC, your existing IAM, your existing logging
- Edge — automotive, retail, factory floor, mobile

What we handle

The stack between "the model is trained" and "the model is in production".

- Quantization: QAT, GPTQ, AWQ, INT4/INT8
- Inference: vLLM, TGI, llama.cpp, TensorRT-LLM
- Autoscaling, rolling deploys, blue/green
- Observability: tokens/sec, queue depth, OOMs, evals

What you own

Everything. We don't gate-keep the model or the stack.

- The model weights — checked into your artifact store
- The serving config — declarative, in your repo
- The data pipeline — runs in your perimeter
- The upgrade path — no phone-home, no license server

Three steps. No surprises.

01

Survey

One week. We read your infrastructure, security requirements, and latency budgets.

02

Pilot

Three to four weeks. We deploy a single workload end-to-end and validate the stack.

03

Scale

Six to eight weeks. We move the rest of the workloads over, with your team driving.

100%

YOU OWN THE WEIGHTS

0

PHONE-HOME OR LICENSE SERVERS

6 wks
