CUSTOMER-HOSTED MODERNIZATION

THE AGENTIC MODERNIZATION FACTORY

Papyrus turns requirements, constraints, and blockers into scoped tasks, coordinated workflows, and working apps - using your documents and systems inside your environment.

REQUIREMENTS > COORDINATED ACTION > DELIVERY

DEFINE THE REQUIREMENTS

Requirements / constraints / blockers

TURN BLOCKERS INTO ACTION

Scoped tasks / approved tools / workflows

DELIVER AND REUSE

Working apps / outputs / reusable skills

01

Document automation

From source material to requirements and deliverables.

02

Internal app creation

From a workflow idea to a focused operational surface.

03

Legacy enablement

From terminal processes to a modern service experience.

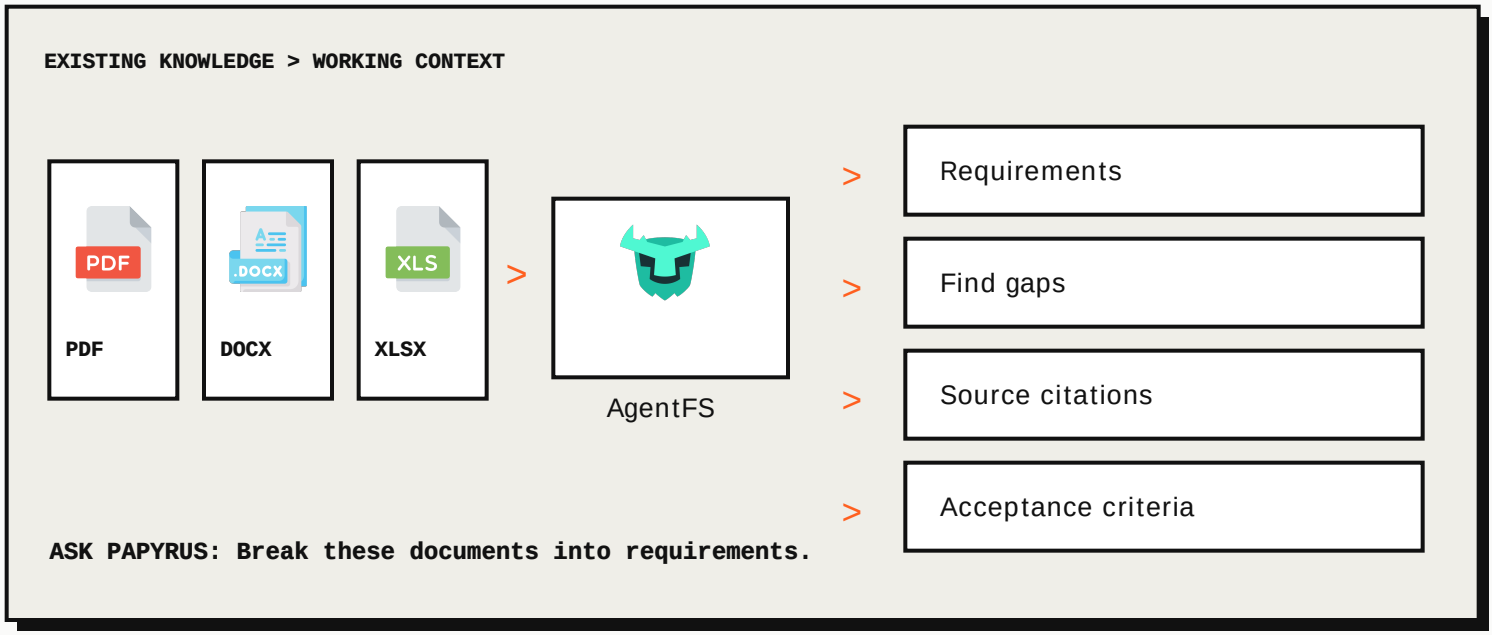

Requirements define the work. Blockers reveal the next task. Papyrus coordinates approved tools, human review, and durable execution to turn both into useful deliverables.

BRING A REAL BOTTLENECK. TURN BLOCKERS INTO ACTION.

01 / DOCUMENT AUTOMATION

YOUR DOCUMENTS ARE THE STARTING POINT.

Turn reading and re-keying into requirements, decisions, and deliverables. Bring PDFs, Word documents, spreadsheets, and CSV data into shared working context.

Print adaptation of the product page demo. Sample sources and illustrative outputs.

- Source-linked analysis. Organize requirements, identify policy and delivery gaps, and define acceptance criteria with references.
- Useful outputs. Draft briefings, reports, registers, spreadsheets, CSV exports, and review-ready document packets.
- Repeatable work. Keep artifacts and working methods in the workspace for recurring reporting and operational workflows.

SOURCE MATERIAL > REQUIREMENTS > ACTIONABLE TASKS

02 / INTERNAL APP CREATION

TURN REQUIREMENTS INTO APPS THAT MOVE WORK.

Turn the requirements and bottlenecks in your process into task-focused forms, views, and workflows your team can use.

Illustrative factory app surfaces; configurations depend on the customer workflow.

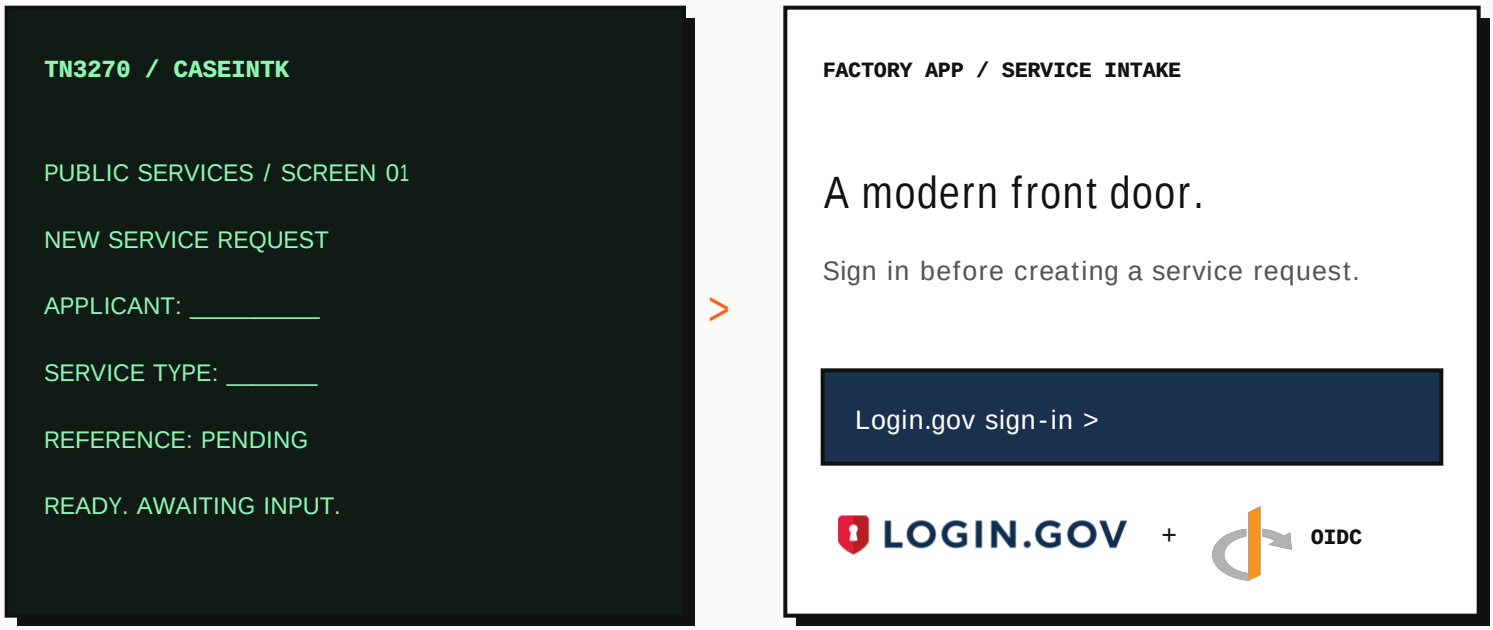

- Forms and views. Capture structured information and surface status, results, and operational data.
- Agent-assisted delivery. Use models, approved tools, and reusable skills to prepare content and support workflow execution.
- Identity-aware access. Papyrus uses Microsoft Entra for workspace identity; generated apps can use a separate authentication front door.
- Human review. Keep consequential actions visible and route them through the configured approval process.

FROM REQUIREMENTS TO WORKING APPS AND WORKFLOWS

03 / LEGACY SYSTEM ENABLEMENT

A NEW FRONT DOOR. FOR THE SYSTEMS YOU ALREADY HAVE.

Keep the system of record. Give people a better way to use it through connected, identity-aware service apps.

Illustrative product page demo: simulated Login.gov / OIDC and a mock TN3270 host. No real sign-in or host connection is shown.

- Connect the existing process. Bind the app to a customer-approved integration and verify its connection before using workflow actions.
- Capture structured work. Identity opens the app; the form captures a request; an approved action updates the legacy record.

MODERNIZE THE EXPERIENCE. KEEP THE RECORD.

RUNTIME / INTEGRATIONS / GOVERNANCE

DURABLE WORK. GOVERNED EXECUTION.

A shared workspace for context, agent execution, and useful outputs - with the runtime and controls close to your systems.

- Mastra runtime. Sessions, memory, schedules, workflows, and signal delivery support durable agent work.
- Reusable skills and artifacts. Retain useful outputs and working methods so the next task starts with context.
- Model and gateway flexibility. Connect customer-approved inference endpoints and select the models available in your environment.
- Tools and MCP. Connect the capabilities, tools, and data sources the workflow needs.
- Plugin architecture. Teams, Exchange email, ACP, A2A, and customer system integrations are adapters; the runtime remains independent.
- Governed connector lifecycle. Draft, test, submit for approval, activate, then monitor health or disable.
- Approvals and observability. Review consequential actions and retain durable records and traces for inspection.
- Microsoft Entra roles. Separate integration access, integration management, security management, action approval, audit access, and system ownership.

CONNECTOR LIFECYCLE

Draft > Tested > Approval > Active > Health monitoring

REQUIREMENTS TO TASKS. BLOCKERS TO RESOLVED WORK.

DEPLOYMENT / COMMERCIAL MODEL / NEXT STEP

YOUR ENVIRONMENT. YOUR OPERATING MODEL.

Customer-hosted execution keeps Papyrus close to your people, documents, and systems. Start with a blocked workflow, define success, and make the work repeatable.

- Customer-hosted deployment. Deploy on Azure or discuss your controlled environment and operating requirements.
- Secrets stay referenced. Connector configuration uses customer-vault, certificate, or managed-identity references; inline tokens and keys are rejected.
- Sandboxed execution. The documented Linux execution profile uses Bubblewrap with network denied and off-host execution disabled.
- Offline licensing. Signed offline licenses use customer-pinned authorities and require no Beag cloud callback. Enterprise deployment rights are defined in the agreement.

ENTERPRISE PRICING / DIRECT ENGAGEMENT

PILOT ENGAGEMENT

$250,000

90 DAYS

A scoped modernization pilot with implementation, integrations, and dedicated live support. Deliverables, acceptance criteria, coverage, and response targets are agreed before kickoff.

ENTERPRISE LICENSE

$2,000,000

2 YEARS

Unlimited customer-hosted VMs within the licensed organization, including offline deployment. Implementation, maintenance, and support scope are defined in the agreement.

DISCOVER > CONFIGURE > PILOT > EXPAND
